$\mathbb{N D} 770$

Position Display Units for Lathes

## Position display

(ND 730 only two axes)

- Select coordinate axes (ND 730 only X and Z)
- Select axis-specific operating parameters

This manual is for ND display units with the following software numbers or higher:

ND 730 for two axes 246 271-06
ND 770 for three axes
246 271-06

## About this manual!

This manual is divided into two parts:

## Part I: Operating Instructions:

- Fundamentals of positioning
- ND functions

Part II: Installation and Specifications:

- Mounting the display unit on the machine
- Description of operating parameters

## Part I Operating Instructions

| Fundamentals | $\mathbf{4}$ |
| :--- | ---: |
| Switch-On, Reference-Mark Traverse | $\mathbf{1 0}$ |
| Selecting Radius or Diameter Display | $\mathbf{1 1}$ |
| Separate Value/Sum Display |  |
| (only ND 770) | $\mathbf{1 2}$ |
| Datum Setting | $\mathbf{1 3}$ |
| Setting the absolute workpiece datum | 13 |
| Entering tool data (relative datums) | 14 |
| Holding Positions | $\mathbf{1 5}$ |
| Moving the Axes with Distance-To-Go | $\mathbf{1 7}$ |
| Taper Calculator | $\mathbf{1 9}$ |
| Error Messages | $\mathbf{2 3}$ |
| Part II |  |
| Installation and Specifications | $\mathbf{2 5}$ |

## Fundamentals

$m$ You can skip this chapter if you are already familiar with coordinate systems, incremental and absolute dimensions, nominal positions, actual positions and distance-to-go!

## Coordinate system

To describe the geometry of a workpiece, a rectangular or Cartesian* coordinate system is used. The Cartesian coordinate system consists of three mutually perpendicular axes $\mathrm{X}, \mathrm{Y}$ and Z . The point of intersection of these axes is called the datum or origin of the coordinate system.

Think of the axes as scales with divisions (usually in millimeters) that allow us to fix points in space referenced to the datum.

To determine positions on a workpiece, the coordinate system is "laid" onto the workpiece.

With lathe work (i.e. rotationally symmetrical workpieces), the $Z$ axis moves along the axis of rotation, and the $X$ axis moves in the direction of the radius or diameter. The $Y$ axis can be disregarded since it would always have the same values as the X axis.

1) Named in honor of the French mathematician and philosopher René Descartes (1596 to 1650)

## Cross slide, saddle and top slide

On conventional lathes, the tool is mounted on a slide that moves in the direction of the $X$ axis (the cross slide) and in the direction of the $Z$ axis (the saddle).

Most lathes have a top slide above the saddle. The top slide moves in Z axis direction and is designated Zo .

## Datum setting

The workpiece drawing is used as the basis for machining the workpiece. To enable the dimensions in the drawing to be converted into traverse distances of machine axes $X$ and $Z$, each drawing dimension requires a datum or reference point on the workpiece (since a position can only be defined in relationship to another position).

The workpiece drawing always indicates one absolute datum (the datum for absolute dimensions). However, it may contain additional, relative datums.

In the context of a numerical position display unit, datum setting means bringing the workpiece and the tool into a defined position in relation to each other and then setting the axis displays to the value which corresponds to that position. This establishes a fixed relationship between the actual positions of the axes and the displayed positions.
With the ND, you can set one absolute datum point and as many as 9 relative datum points (tool datums), and store them in nonvolatile memory.

## Tool datums (tool compensation)

Your display unit should show you the absolute position of the workpiece, regardless of the length and shape of the particular tool being used. For this reason you must determine the tool data and enter it. First touch the workpiece with the cutting edge of the tool and then enter the associated display value for that position.
You can enter tool data for up to 9 tools. When you have set the absolute workpiece datum for a new workpiece, all tool data (= relative datum points) are referenced to the new workpiece datum.

## Nominal position, actual position and distance-to-go

The positions to which the tool is to move are called the nominal positions (S). The position at which the tool is actually located at any given moment is called the actual position (1).

The distance from the nominal position to the actual position is called the distance-to-go ( $®$ ).

## Sign for distance-to-go

When you are using the distance-to-go display, the nominal position becomes the relative datum (display value 0 ). The distance-to-go is therefore negative when you move in the positive axis direction, and positive when you move in the negative axis direction.

## Absolute workpiece positions

Each position on the workpiece is uniquely defined by its absolute coordinates.

## Example Absolute coordinates of position (1):

$$
\begin{aligned}
& X=5 \mathrm{~mm} \\
& Z=-35 \mathrm{~mm}
\end{aligned}
$$

If you are working according to a workpiece drawing with absolute dimensions, you are moving the tool to the coordinates.

## Relative workpiece positions

A position can also be defined relative to the previous nominal
 position. The datum for the dimension is then located at the previous nominal position. Such coordinates are termed relative coordinates or chain dimensions. Incremental coordinates are indicated by a preceding I.

## Example <br> Relative coordinate of position (2) referenced to

 position (1):$$
\begin{aligned}
& I X=10 \mathrm{~mm} \\
& Z=-30 \mathrm{~mm}
\end{aligned}
$$

If you are working according to a workpiece drawing with incremental dimensions, you are moving the tool by the dimensions.

## Sign for incremental dimensioning

A relative dimension has a positive sign when the axis is moved in the positive direction, and a negative sign when it is moved in the negative direction.

## Position encoders

The position encoders on the machine convert the movements of the machine axes into electrical signals. The ND display unit evaluates these signals, determines the actual position of the machine axes and displays the position as a numerical value.
If the power is interrupted, the relationship between the machine axis positions and the calculated actual positions is lost. The reference marks on the position encoders and the REF reference mark evaluation feature enable the ND to quickly re-establish this relationship again when the power is restored.

## Reference marks

The scales of the position encoders contain one or more reference marks. When a reference mark is crossed over, a signal is generated identifying that position as a reference point (scale datum = machine datum).

When this reference mark is crossed over, the ND's reference mark evaluation feature restores the relationship between axis slide positions and display values as you last defined it by setting the datum. If the linear encoders have distance-coded reference marks, you need only move the machine axes a maximum of 20 mm to restore the datum.

## Switch-On, Reference-Mark Traverse

| ENT $\ldots$ CL | Turn on the power (switch located on rear panel). <br> REF starts blinking in the status display. |
| :--- | :--- | :--- |
|  | Confirm reference-point traverse. <br> REF is now lighting. Decimal points are blinking. |

Crossing over the reference marks stores the last relationship between axis slide positions and display values for all datum points in nonvolatile memory.

Note that if you choose not to cross over the reference marks (by clearing the dialog ENT ... CL with the CL key), this relationship will be lost if the power is switched off or otherwise interrupted!

```
04. You must cross over the reference marks if you want to use
the multipoint axis error compensation function.
(See "Multipoint Axis Error Compensation")
```

## Selecting Radius or Diameter Display

Your ND can display positions in the cross slide as a diameter or as a radius. Drawings of lathe parts usually indicate diameters. When you are turning the part, however, you infeed the tool in the cross slide axis in radius values

Example: Radius display position (1)

$$
\begin{aligned}
X & =20 \mathrm{~mm} \\
X & =40 \mathrm{~mm}
\end{aligned}
$$

## To switch the display:

```
Press \(\mathbf{R}_{x}\)
```

0 When radius display for the $X$ axis is selected, $R_{X}$ lights up. When diameter display is selected, $R_{X}$ goes out

## Separate Value/Sum Display (ND 970 only)

## Separate value display

In this mode the positions of the saddle and top slide are displayed separately. The position displays are referenced to the datum points that you set for the $Z o$ and $Z$ axes. When an axis slide moves, only the position display for that axis changes.

## Sum display

In this mode the position values of both axis slides are added together. The sum display shows the absolute position of the tool, referenced to the workpiece datum.

| Example | Separate value display: | $Z=+25.000 \mathrm{~mm}$ |
| :--- | :--- | :--- |
|  | $Z_{0}=+15.000 \mathrm{~mm}$ |  |
|  | Sum display: | $Z_{S}=+40.000 \mathrm{~mm}$ |

The sum display will only show correct values if the actual position values of both axis slides were correctly added and entered (with sign) when setting the datum for the "sum."

## To switch the display

Sum display: Press the keys $Z o$ and $Z$ at the same time.

- Separate value display: Press the key Zo.

When the ND 770 displays sums, the Zo display is switched off.

## Datum Setting

- If you want datum points to be stored in nonvolatile memory, you must first cross over the reference marks.
- Note that the correct value to be entered for the datum in the $X$ axis depends on whether you have selected radius or diameter display.

With the ND 730/ND 770 position displays, you can set one absolute workpiece datum and data for up to 9 tools (relative datums).

## Setting the absolute workpiece datum

When you enter a new value for the absolute workpiece datum, all tool data are then based on the new workpiece datum.

Touch the workpiece end face with the tool.

Select the axis, SET begins to blink

0 ENT
Enter the position of the tool tip, e.g. 0 mm . Confirm with ENT.

[^0]Entering tool data (relative datums)

## Holding Positions

If you want to measure the workpiece after turning the first diameter, your display unit has to capability to "freeze" (hold) the actual position before you retract the tool.

Retract the tool. The X axis display remains stopped. Measure the workpiece.

## Moving the Axes with the Distance-To-Go Display

Normally, the display shows the actual position of the tool. However, it is often more helpful to display the remaining distance to the nominal position (distance-to-go). You can then position simply by moving the axis until the display value is zero.

Application example: Finish turning a shoulder by traversing to zero

## Taper Calculator

The taper calculator enables you to calculate the angle for the top slide. There are two possibilities:

- Calculation from the taper ratio:
- Difference between the taper radii to the length of the taper
- Calculation from two diameters and the length:
- Starting diameter
- Final diameter
- Length of the taper

## Calculation from the taper ratio

## TAPER CALC.

ENT $\quad$ Confirm function.

You can change entered values later by selecting them with the ENT key or the TOOL key.

Calculation from two diameters and the length

TAPER CALC.

TAP. RATIO

TAP. DIMENS.

## DIA. RIGHT

10 ENT
Enter value, e.g. 10 mm , confirm with ENT.

## DIA. LEFT

20 ENT
Enter value, e.g. 20 mm, confirm with ENT.

ANGLE $=9.462$
The result is displayed in the message field.

## Error Messages

| Message | Cause and Effect |
| :--- | :--- |
| SIGNAL X | The encoder signal is too weak. <br> The scale may be contaminated. |
| ERR. REF. X | The spacing of the reference <br> marks as defined in P43 is not <br> the same as the actual spacing. |
| FRQ. ERR. X | The input frequency for this <br> encoder input is too high. This <br> can occur when the scale is <br> moved too fast. |
| ERR. MEMORY | Checksum error! <br> Check the datum, operating <br> parameters and compensation <br> values for multipoint axis-error <br> compensation. If this error recurs, <br> contact your service agency. |

## To clear error messages

When you have removed the cause of the error:
> press the CL key.

## Part II Installation and Specifications

| Items Supplied | $\mathbf{2 6}$ |
| :--- | :--- |
| Connections on Rear Panel | $\mathbf{2 7}$ |
| Mounting | $\mathbf{2 8}$ |
| Power Supply | $\mathbf{2 8}$ |
| Connecting the Encoders | $\mathbf{2 9}$ |
| Operating Parameters | $\mathbf{3 0}$ |
| Entering/changing operating parameters | 30 |
| Operating parameter list | 31 |
| Linear Encoders | $\mathbf{3 3}$ |
| Setting the display step | 33 |
| Display step, signal period and subdivision | 33 |
| Compatible HEIDENHAIN linear encoders | 34 |
| Multipoint Axis Error Compensation | $\mathbf{3 6}$ |
| Input in compensation value table | 36 |
| Selecting compensation value table, |  |
| entering axis error values | 37 |
| Deleting compensation value table | 38 |
| Specifications | $\mathbf{3 9}$ |
| Dimensions ND $730 / 770$ | 40 |

Items Supplied

- ND 730 for 2 axes
or
- ND 770 for 3 axes
- Power connector Id. Nr. 257 811-01
- User's Manual

Optional Accessories

- Tilting base for mounting on underside of housing Id. Nr. 281 619-01

## Connections on Rear Panel

## Mounting

To mount the display unit on a support, use the M4 threaded holes in the rubber feet. You can also mount the display unit on the optional tilting base.

## Power Connection

Hot leads (L) and (N)
Protective ground $\left(\frac{1}{5}\right)$

- Danger of electrical shock!

Connect a protective ground. This connection must never be interrupted

- Unplug the power cord before opening the housing.

To increase the noise immunity, connect the ground terminal on the rear panel to the central ground point of the machine (minimum cross-section: $6 \mathrm{~mm}^{2}$ ).

The display unit will operate over a voltage range of 90 Vac to 260 Vac . A voltage selector is not necessary.

## Connecting the Encoders

Your display unit will accept all HEIDENHAIN linear encoders with sinusoidal output signals ( 11 to $16 \mu \mathrm{~A}_{\mathrm{pp}}$ ) and distance-coded or single reference marks.

## Assignment of the encoder inputs for the ND 730

Encoder input X 1 is for the X axis
Encoder input $X 2$ is for the $Z$ axis

## Assignment of the encoder inputs for the ND 770

Encoder input X 1 is for the X axis
Encoder input $X 2$ is for the $Z o$ axis
Encoder input X 3 is for the Z axis

## Encoder monitoring

Your display unit features a monitoring system for checking the amplitude and frequency of the encoder signals. If it detects a faulty signal, one of the following error messages will be generated:

## SIGNAL X

FRQ. ERR. X
Encoder monitoring can be activated with parameter 45.
If you are using linear encoders with distance-coded reference marks, the encoder monitoring system also checks whether the spacing of the reference marks as defined in parameter P43 is the same as the actual spacing on the scales. If it is not, the following error message will be generated:

ERR. REF. X

## Operating Parameters

Operating parameters allow you to modify the operating characteristics of your display unit and define the evaluation of the encoder signals. Operating parameters that can be changed by the user are called user parameters, and can be accessed with the SPEC FCT key and the dialog PARAMETER (user parameters are identified as such in the parameter list). The full range of parameters can only be accessed via the dialog "CODE" and input of the code number 95148.

Operating parameters are designated by the letter P and a number. Example: P11. The parameter designation is shown in the $X$ display when a parameter is selected with the TOOL and ENT keys.
The parameter setting is shown in the $\mathrm{Z}=\mathrm{ND} 730 /$
Zo = ND 770 display.
Some operating parameters have separate values for each axis. Such parameters have an additional index number from 1 to 3 with the ND 770 and from 1 to 2 with the ND 730.
Example: $\quad \mathrm{P} 12.1$ scaling factor, X axis
P12.2 scaling factor Zo axis (only ND 770)
P12.3 scaling factor, $Z$ axis
The operating parameters are preset before the unit leaves the factory. These factory settings are indicated in the parameter list in boldface type.

## Entering/changing operating parameters

## Calling operating parameters

- Press the SPEC FCT key
- Press SPEC FCT or TOOL until "PARAMETER" is displayed in X .
> Confirm with ENT.

## Selecting protected operating parameters

> Select the P00 CODE user parameter with the TOOL key.

- Enter the code number 95148.
> Confirm with ENT.

## Scrolling through the operating parameter list

> Scroll forwards: Press the ENT key.
> Scroll backwards: Press the TOOL key.

## Changing parameter settings

> Press the minus key or enter the value and confirm with the ENT key.

## Correcting an entry

> Press CL. This restores the old value.

## Exiting the operating parameters

> Press SPEC FCT or CL.

## List of operating parameters

| P00 CODE Enter the code number |  |
| :---: | :---: |
| Change protected operating parameters |  |
| Display the software version (in the X axis) |  |
| Display the date of release (in the Y axis) |  |
| Multipoint axis error compensation |  |
| P1 Unit of measurement ${ }^{1)}$ |  |
| Display in millimeters | MM |
| Display in inches | INCH |
| P06 Select the sum display |  |
| Sum display is switched on | SUM ON |
| Sum display can be selected |  |
| with the Z0 and $Z$ keys | SUM OFF |
| P3.1 to P3.3 Radius/diameter display ${ }^{1)}$ |  |
| Display position value as radius | RADIUS |
| Display position value as diameter | DIAMETER |
| P11 Activate scaling factor ${ }^{1)}$ |  |
| Scaling factor active | SCALING ON |
| Not active | SCALING OFF |
| P12.1 to P12.3 Enter scaling factor ${ }^{1)}$ |  |
| Enter a scaling factor separately for each axis: |  |
| Entry value > 1: workpiece will "grow" |  |
| Entry value = 1: workpiece will remain the same size |  |
| Entry value < 1: workpiece will "shrink" |  |
| Input range: | 0.111111 to 9.999999 |
| Factory setting: | 1 |

## P30.1 to P30.3 Counting direction

Positive counting direction with
positive direction of traverse
DIRECT. POS
Negative counting direction with
positive direction of traverse DIRECT. NEG

## P31.1 to P31.3 Signal period of the encoder

| Input range: | 0.00000001 to $99999.9999 \mu \mathrm{~m}$ |
| :--- | :--- |
| Default setting: | $\mathbf{2 0} \boldsymbol{\mu \mathrm { m }}$ |

## P33.1 to P33.3 Counting step

0-1-2-3-4-5-6-7-8-9
0-2-4-6-8
0-5

## P38.1 to P38.3 Decimal places

1 / 2 / 3 / 4 / 5 / 6 (up to 8 with inches display)

## P40.1 to 40.3 Define axis error compensation

$\begin{array}{ll}\text { Axis error compensation not active } & \text { CORR. OFF } \\ \text { Linear axis error compensation active } & \text { CORR. LIN }\end{array}$ Multipoint axis error compensation active CORR. ABS (See "Multipoint Axis Error Compensation")

## P41.1 to P41.3 Linear axis error compensation

Linear axis error compensation is activated via parameters 40.1 to 40.3 .

$$
\text { Input range }[\mu \mathrm{m}]: \quad-99999 \text { to }+99999
$$

Default setting:

$$
0
$$

Example: Displayed length $\quad L_{a}=620.000 \mathrm{~mm}$
Actual length (as determined for example with
the VM 101 from HEIDENHAIN)
$\mathrm{L}_{\mathrm{a}}=619.876 \mathrm{~mm}$
Difference $\Delta L=L_{a}-L_{d}=-124 \mu m$
Compensation factor $k$ :
$\mathrm{k}=\Delta \mathrm{L} / \mathrm{L}_{\mathrm{d}}=-124 \mu \mathrm{~m} / 0.62 \mathrm{~m}=\mathbf{- 2 0 0}[\mu \mathrm{m} / \mathrm{m}]$

## P43.1 to P43.3 Reference marks

| One reference mark | SINGLE REF . |  |
| :--- | :--- | :--- |
| Distance-coded with $500 \cdot$ SP | 500 | SP |
| Distance-coded with $1000 \cdot$ SP | 1000 | SP |
| Distance-coded with $2000 \cdot$ SP | 2000 | SP |
| Distance-coded with $5000 \cdot$ SP | 5000 | SP |

(SP = signal period)
P44.1 to P44.3 Reference mark evaluation

Evaluation active
Evaluation not active

REF. X ON
REF. X OFF

## P45.1 to P45.3 Encoder monitoring

Amplitude and frequency monitoring active

ALARM ON
Amplitude and frequency monitoring not active

ALARM OFF

## P48.1 to P48.3 Activate axis display

| Axis display active | AXIS ON |
| :--- | :--- |
| Axis display not active | AXIS OFF |

## P80 Function of CL key

| Reset with CL | CL . . RESET |
| :--- | :--- |
| No reset with CL | CL . . . . . OFF |

[^1]
## Linear Encoders

## Setting the display step with linear encoders

The display step depends on the:

- Signal period (P31)
- Counting step (P33)
- Decimal places (P38)

## Example

Linear encoder with signal period $10 \mu \mathrm{~m}$
Required display step .............. 0.0005 mm
Signal period (P31) 10
Counting step (P33) ................. 5
Decimal places (P38) 4

The tables on this page and the next pages will help you selecting your parameters.

## Linear Encoders

Parameter settings for HEIDENHAIN linear encoders with $11 \mu \mathrm{~A}_{\mathrm{pp}}$ signals

## Example:

Your encoder: LS 303 C, desired display step: $0.005 \mathrm{~mm}(5 \mu \mathrm{~m})$, parameter settings:
$\mathrm{P} 01=\mathrm{mm}, \mathrm{P} 43=1000, \mathrm{P} 32=4, \mathrm{P} 33=5, \mathrm{P} 38=3$

## Multipoint Axis Error Compensation

## alk

If you want to use the multipoint axis error compensation feature, you must

- Activate this feature with operating parameter P40 (see "Operating Parameters")
- Traverse the reference marks after switching on the display unit.
- Enter compensation value table

Your machine may have a non-linear axis error due to factors such as axis sag or drivescrew errors. Such deviations are usually measured with a comparator measuring system. This allows you to determine, for example, the screw pitch error $[X=F(X)]$ for the $X$ axis.

An axis can only be corrected in relation to one axis causing the error. You can create a compensation value table for each axis, with each table containing 64 compensation values.
The compensation value table is selected with the SPEC FCT key and the dialog "PARAMETER/CODE". All of the input values required for the multipoint compensation are requested via dialog.

To determine the compensation values (e.g. with a VM 101), the REF display must be selected after selecting the compensation-value table.

| $\mathbf{R}_{\mathbf{x}}$ | Select REF display. |
| :--- | :--- |

The decimal point in the left display field indicates that the displayed values are referenced to the reference point. If the decimal point blinks, the reference marks have not been traversed.

## Entries in the compensation value table

- Axis to be compensated: X, Zo or Z (Zo only ND770)
- Axis with error: $\quad$ X, Zo or Z
(Zo only ND770)
- Datum for the axis to be corrected:

Here you enter the point starting at which the axis with error is to be corrected. This point indicates the absolute distance to the reference point.

Do not change the datum point after measuring the axis error and before entering the axis error into the compensation table.

- Spacing of the compensation points

The spacing of the compensation points is expressed as $2^{x}[\mu \mathrm{~m}]$. Enter the value of the exponent $x$ into the compensation value table.
Minimum input value:

$$
\begin{aligned}
& 6 \text { (= } 0.064 \mathrm{~mm}) \\
& 20(=1052.672 \mathrm{~mm}) \\
& 23 \text { (= } 8388.608 \mathrm{~mm})
\end{aligned}
$$

Maximum input value:
Example: 900 mm traverse and 15 compensation points: results in 60.000 mm spacing between points. Nearest power of two: $2^{16}[\mu \mathrm{~m}]=65.536 \mathrm{~mm}$ Entry in compensation value table: 16

- Compensation value

You enter the measured compensation value (in millimeters) for the displayed compensation point. Compensation point 0 always has the value 0 and cannot be changed.

To select comp. value table and enter an axis correction

## Deleting a compensation value table

| 1 | $\mathbf{0}$ | $\mathbf{5}$ | 2 | Enter105296 and confirm with ENT. |
| :--- | :--- | :--- | :--- | :--- |

 e.g. for Z axis, and delete the table.

Confirm with ENT, or cancel with CL.

## Specifications

| Housing | ND $730 / \mathrm{ND} \mathrm{770}$ <br> Bench-top design, cast metal <br> Dimensions (W $\bullet \mathrm{H} \bullet \mathrm{D})$ <br> $270 \mathrm{~mm} \times 172 \mathrm{~mm} \times 93 \mathrm{~mm}$ |
| :--- | :--- |
| Operating temp. | $0^{\circ}$ to $45^{\circ} \mathrm{C}\left(32^{\circ}\right.$ to $\left.113^{\circ} \mathrm{F}\right)$ |
| Storage temp. | $-20^{\circ}$ to $70^{\circ} \mathrm{C}\left(-4^{\circ}\right.$ to $\left.158^{\circ} \mathrm{F}\right)$ |
| Weight | Approx. 2.3 kg |
| Relative humidity | $<75 \%$ annual average <br> $<90 \%$ in rare cases |
| Power supply | 90 Vac to 260 Vac <br> 48 Hz to 62 Hz |
| Power consumption | 15 W |
| Protection | $\mathrm{IP40}$ according to EN 60529 |

| Encoder inputs | For encoders with 7 to $16 \mu \mathrm{App}$ Grating period 2, 4, 10, 20, 40, 100, $200 \mu \mathrm{~m}$ and 12.8 mm Reference-mark evaluation for distance-coded and single reference marks. |
| :---: | :---: |
| Input frequency | Max. 100 kHz with $30 \mathrm{~m}(66 \mathrm{ft})$ cable |
| Display step | Adjustable <br> (see "Linear Encodes") |
| Tool datums | 9 (nonvolatile) |
| Functions | - Distance-to-go display <br> - Radius/diameter display <br> - Separate value/sum display (only ND 770) <br> - Hold position <br> - Set absolute datum <br> - Taper calculator <br> - Scaling factor |
